```
::::::::::::::
Lab1Status.txt
::::::::::::::
Problem 1:
Status update 1:
Output separates correctly due to for loop, but only displays total number of peop
le rather than separating i.e. "name number 1" "name number 2" etc.

Status update 2:
Name number lines now separated, but "shouts Hello" line is missing, only first na
me displays.

Status update 3:
Names all combined with no "and" for ex: "Tony and Joe".

Status update 4:
All names besides last are concatenated if more than 3.

Status update 5:
Accidental extra space between commas.

Status update 6:
Statement repeats itself, incorrect output.

Status update 7:
Output is correct with 2 people.

Status update 8:
Output is correct entirely.

Problem 2:
Status update 1:
Output fully functional for when user input equals zero, everything else non funct
ional.

Status update 2:
Output correctly interprets number of pairs to amount of lines needed for number a
nd weight.

Status update 3:
Program is fully functional with correct output except that weighted mean is not d
ivided by total of all weight(s). Simple mean is correct.

Problem 3:
Status update 1:
Everything is functional except for Each + method ref and palindrome

Status update 2:
Palindrome still not operating

Status update 3:
ERROR RESOLVED: missing break lines

Output fully functional. ::::::::::::::
Lab1Conclusions.txt
::::::::::::::
In this lab, I learned how to iterate through an ArrayList in multiple different w
ays i.e. (reading through in reverse, reading the third index), and the way to per
form those iterations can be done in even MORE ways. I found doing the same thing
in a different way to be useful and has definitely gained me some experience as a
computer scientist. ::::::::::::::
